

## **AUTOWATCH**

### **MOTORCYCLE Immobiliser/Alarm**

#### **500Rli Immobiliser/Alarm.**

##### Features

In addition to immobilising your motorcycle, the 500Rli is able to detect interference with your bike and trigger the alarm siren to draw attention to a potential thief. The system incorporates an “intelligent” impact sensor, which is able to differentiate between a bump and an attempted theft where the bike will be tilted or moved.

When the alarm is set, the siren will emit a warning sound on detecting a bump, but will trigger a full alarm cycle if the bike is interfered with further. The alarm system also incorporates an anti-hot wire trigger and has an optional facility to trigger the alarm if a pannier or delivery box is opened. The 500 Rli also includes an optional facility to flash the indicator lights in conjunction with the siren sounding.

Low battery drain. The 500 Rli security system has been designed to draw a very small amount of current from your bike’s battery during normal operation (less than 5mA). If the motor cycle is not used for a few days, the 500Rli system will automatically go into “sleep mode” to reduce the current consumption to less than 0.5mA
