

## ▶ AVS DETECTOR

**The AVS Detector is a factory alarm expansion module that allows after market sensors to be easily and cost effectively added to factory systems.**

Many cars today come with a basic factory fitted alarm system that only triggers when a door (and sometimes the bonnet or boot) is opened. The AVS Detector allows extra sensors to be added to the factory system easily and cost effectively.

**Any AVS after market sensor can be easily added including:**

- ✓ Shock sensor – detects an impact to the body of the vehicle.
- ✓ Glass break sensor – detects the sound frequency of breaking glass.
- ✓ Digital tilt sensor – protects mag wheels by setting itself for the angle the car is parked on and triggering the alarm if the car is tilted in ANY direction from one degree.
- ✓ Ultrasonic sensor – detects movement within the cabin of the vehicle for superior cabin protection.
- ✓ Microwave sensor – detects body mass entering the vehicle. Ideal for convertibles.
- ✓ PIR sensor – triggers the alarm if the infrared sensor detects body heat and movement (use to protect the rear of vans and trucks).
- ✓ Reed switch – will trigger if the two halves are moved apart while the alarm is armed (use to protect ute canopies).

**Installation can usually be completed in as little as 10 minutes** because you are simply adding a sensor to the existing alarm without installing a full overlay alarm system.

Because the AVS Detector uses the original OEM alarm and remotes there are no hassles with potential lock-outs or after-market alarm failures. This makes it the perfect product for adding to new vehicles at the dealer level.

### **AVS Detector features:**

- ✓ Simple 5-wire hook-up
- ✓ 2 x plug-in sensor ports
- ✓ Adjustable to work with most factory alarms
- ✓ Very cost effective alternative to full alarm replacement
