

## AVS SMS UPGRADE MODULE

The AVS SMS Upgrade module can be added to any car alarm for two-way text message communication.

- Can be added to **any** AVS alarm (or other brand of alarm with pager out)
- Sends an SMS to **up to 5 mobiles** (Vodafone or Telecom) on alarm trigger and will also ring a nominated mobile number after one minute. If the network is overloaded SMS are held back to allow phone calls to get through so this ensures a trigger notification is received.
- **Arms automatically** when the ignition is switched off
- 6-digit alpha/numeric **security PIN** operation
- **Low car battery warning** via SMS
- Optional **car lock/unlock** via SMS (in case keys are locked in the car)
- **Confirmation SMS reply** to each command SMS
- If a tilt sensor is fitted the module will advise via SMS if the car is being towed even if the alarm is not armed
- Option to add up to **three** extra controls such as fuel kill or to turn on extra sirens or lights etc. These are turned on and off via SMS.
- Only ongoing costs are the cost of the SMS the alarm sends to the programmed mobile phones which is charged at the normal network rate
- Just add a Vodafone SIM card (prepaid or on account)
- Easy to install with only three wires and all programming done via SMS
- Uses a Sony Ericsson data modem which is ultra reliable – many cheaper GSM products use inferior modems or even modified cell phones
