573   Passive Proximity Immobiliser

* Two circuit immobilisation
* Completely transparent operation
* Ten trillion possible code combinations
* No buttons to push
* No batteries to replace
* No code to be entered
* Attack proof housing
* Five Pin number override facility
* Up to 8 transponders can be programmed
* Excellent deactivation range
* All black wire harness
* AS/NZ Immobilisation Standards 4601:2000 Certified
* NZ Insurance acceptance
* NZ Star Rating 3

Immobilisation of your vehicle has never been this easy. Simply switch off the engine,lock the doors and walk away while the immobiliser takes care of the rest. When returning to your vehicle, put the key into the ignition, and start the vehicle-no buttons to be pushed, no jackplugs or touchkeys to be inserted, no code numbers to be entered.

The success of this system lies with the small Texas Instruments Tris transponder, sealed in a rugged housing and attached to the key-ring. An energy source in the form of a coil is fitted out of sight under the steering column, and this interrogates the transponder attached to your key-ring. If the code is right, you may start the vehicle. If the code is wrong, or no transponder is attached to your key ring, the vehicle does not start and remains exactly where it is.
